

Javascript-Schnittstelle

IBI-helpMe provides a Javascript interface if you use the HTML-based version of the *Create Support Case* dialog. With this interface, you can replace the entire contents of the *Create Support Case* dialog by your own in-house version (e.g. an existing intranet page) and control IBI-helpMe.

API

IBI-helpMe uses the Javascript object *window.external* for the provision of the interface. In addition, IBI-helpMe is able to trigger certain events. Event handlers need to be defined in the *window* object.
